**Abstract**— Security is the most critical feature of the present e-world. Many applications are based on random number generation. In the present situation, it is very difficult to hide the data. So the key-based encryption process is suggested to keep the files secure. The protection of the data depends on the key. Key generation is more important for all cryptography applications, which is entirely dependent on randomness. As long as many designers have been able to develop many Random Number Generator-based keys. Also work is going on to make hacker data more stable. CSTRNG can be suggested in this work. One of the most commonly used technologies in the marketing field is the production of digital signatures. The generation of digital signatures can be generated using many keys that have the property of RNG. The most stable RNG is the Cryptographically Secured True Random Number Generator (CSTRNG). This could generate more unexpected numbers. Work has been built on the Xilinx ISE simulator.

**Keywords**— Random Number Generator, Digital signature, Cryptographically Secured True Random Number Generator, Cryptography.

## I. INTRODUCTION

Security is very critical today, most security systems are focused on authentication. Digital signatures, facial identification, eye detection and fingerprints may be available in many forms. Similar to all authentication methods, a digital signature is one of the easiest and most safe and easy to use anywhere. The greater the size of the key in the digital signature, the higher the authentication [1]. Digital certificates are the exclusive security key for the authentication of messages.

There are several modern ways to produce digital signature authentication keys [2]. In the physical world, hand-written signatures on hand-written or typed messages are popular. They are used to connect the signer to the text. Additionally, a digital signature is a process that links a person/entity to electronic data. If the signature is unique, the chances of hacking are low.

A SELECTIVE ADSORPTION OF CR (VI) FROM WASTE WATER USING LOW COST BIOSORBENTS

Oguri Sreedevi

Department of Chemistry, Dr. A. P. J. Abdul Kalam University, Indore

Abstract- The results of a study that looked at the possibility of batch-mode removal of Cr(VI) from aqueous solutions using cheap waste biomaterial are presented in this article. As biosorbents, we used cones from *Fomitopsis pinicola*, as well as peach, apricot, and *Juglans regia* stones, orange peels, and Merino sheep wool. We looked at three grain sizes of biosorbents: fr. 1/2, fr. 0.5/1.0, and fr. 0/0.5 mm. Finding the best biosorbent that could be tested using real samples was the goal. Additionally, the effects of additional factors (such as temperature, rotation speed during mixing, pH value, chemical activation of the biosorbent, and the influence of biosorbent concentration. By using chemical activation and lowering the pH to 1.1 to 2.0, they can have their sorption capacities increased and, in the case of some biosorbents, their exposure times shortened. In order to analyse the experimental data and explain the mechanism of adsorption and its potential speed control steps, pseudo-first-order and pseudo-second-order kinetic models were used. The pseudo-second-order kinetic model seems to best fit the experimental data. The biosorption was likely endothermic and spontaneous, according to the thermodynamic parameters. The Langmuir and Freundlich adsorption isotherms were used to describe the adsorption data in the biosorption equilibrium study. For all biosorbents, the Langmuir model could be used to describe the adsorption data. Both designs work well with peachstones and sheep fleece that has undergone chemical treatment.

Keywords: Biosorption; Hexavalent Chromium Cr (VI); Batch Mode; Kinetic; Equilibrium; Thermodynamic Study.
